1 Background

ggplot2 is a powerful graphing library that can make beautiful graphs. ggplot2 can also help us to understand ideas of an underlying "grammar of graphics".

However, ggplot can be difficult to learn. I am thinking that one way to better understand ggplot2 might be to see how this graphing library could be applied to a concrete example of comparing program outcomes.

In this example, **program** is a *factor* and **mental health at time 2** is *numeric*.

2 Load the Simulated Social Service Agency Data

load("social-service-agency.RData") # simulated data

The *mental health* variables are scaled to have an average of 100. Lower numbers indicate lower mental health, while higher numbers indicate higher mental health.

ID	age	gender	race_ethnicity	family_income	program
2892	23	Male	African American	42359	Program B
1971	39	Female	Asian American	66500	Program C
4728	26	Female	Asian American	52726	Program C
1020	24	Male	Latinx	52911	Program D
4429	36	Female	Asian American	50287	Program C
3136	33	Male	African American	45570	Program C

Table 1: Table continues below

mental_health_T1	mental_health_T2	latitude	longitude
95.25	106.8	42.16	-83.6
82.64	96.3	42.29	-83.88
80.49	98.72	42.14	-83.78
93.82	91.67	42.24	-83.68
83.37	99.69	42.18	-83.64
75.28	92.9	42.21	-83.7

3 Load the Libraries

```
library(ggplot2) # beautiful graphs
```

library(ggthemes) # beautiful themes

4 First Approach (x is program; y is mental health)

There is a lot of code below. This is where we are setting up the *grammatical logic* of the graphing approach.

Devoting some time to setting up the initial logic of the plot will pay dividends in terms of exploring multiple geometries later on.

Note that I am adding optional scale_... and theme... arguments just to make the graphs look a little nicer, but these are not an essential part of the code.

5 Add Geometries That Show The Average

Now that we have devoted a *lot of code* to setting up the *grammar* of the graph, it is a relatively simple matter to try out different geometries. The geometries show the *average* value.

5.1 Bar Chart

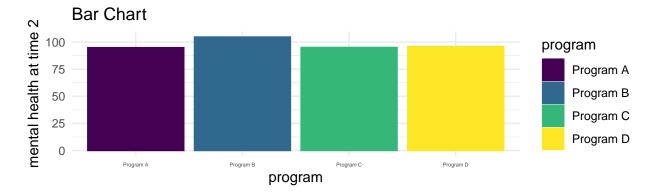

Figure 1: Bar Chart

5.2 Horizontal Bar Chart

Horizontal Bar Chart

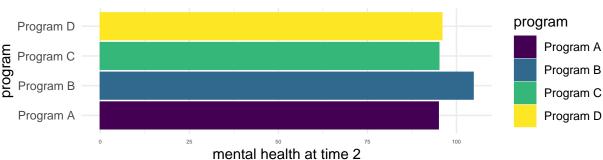

Figure 2: Horizontal Bar Chart

5.3 Point Chart

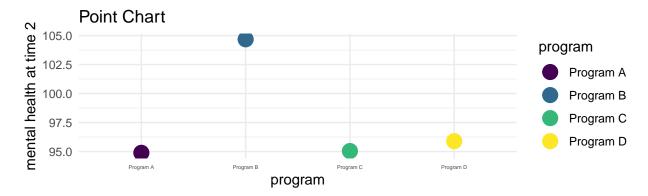

Figure 3: Point Chart

5.4 "Lollipop" Chart

The segments connecting the x axis with the points, require their own geometry that has its own aesthetic.

```
yend = mean(mental_health_T2))) + # y ends at
labs(title = "Lollipop Chart")
```

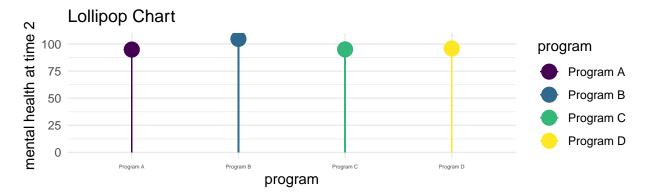

Figure 4: Lollipop Chart

5.5 Line Chart

An extra element of the aesthetic is required for lines.

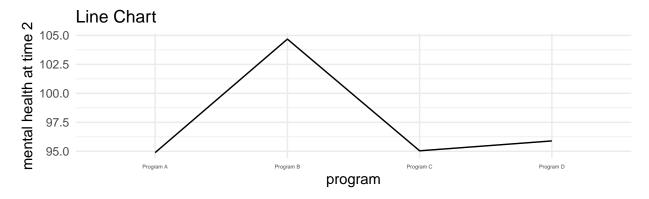

Figure 5: Line Chart

A line chart is likely *not* an appropriate way to show these program outcomes as a line chart is more appropriate when the x axis represents some kind of *time trend*.

6 Add Geometries That Show the Distribution

Now that we have devoted a *lot of code* to setting up the *grammar* of the graph, it is a relatively simple matter to try out different geometries. The geometries show the *distribution* of all values.

6.1 Boxplot

```
myplot1 +
  geom_boxplot(fill="white") + # boxplot geometry
  labs(title = "Boxplot")
```

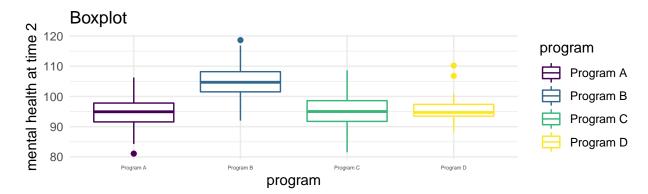

Figure 6: Boxplot

6.2 Violin Plot

```
myplot1 +
  geom_violin() + # violinplot geometry
  labs(title = "Violin Plot")
```

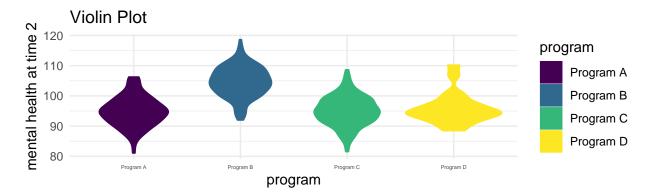

Figure 7: Violin Plot

6.3 Points

```
myplot1 +
  geom_point() + # point geometry
  labs(title = "Points")
```

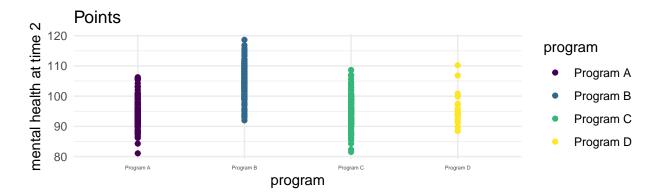

Figure 8: Points

6.4 Jittered Points

```
myplot1 +
  geom_jitter() + # jittered point geometry
  labs(title = "Jittered Points")
```

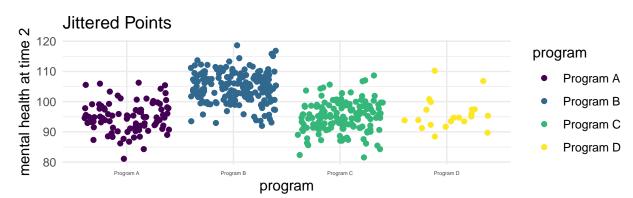

Figure 9: Jittered Points

6.5 Beeswarm Plot

```
library(ggbeeswarm) # beeswarm geometry
myplot1 +
  geom_beeswarm() + # beeswarm geometry
labs(title = "Beeswarm Plot")
```

6.6 Dotplots

```
library(ggdist) # dotplot geometry
myplot1 +
   stat_dots() + # dotplot geometry
   labs(title = "Dotlot")
```

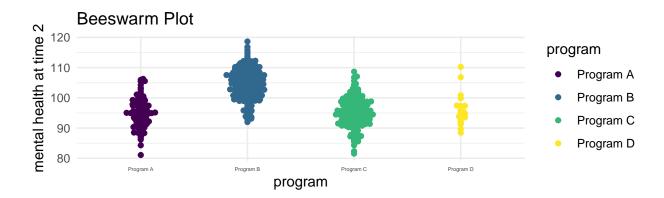

Figure 10: Beeswarm Plot

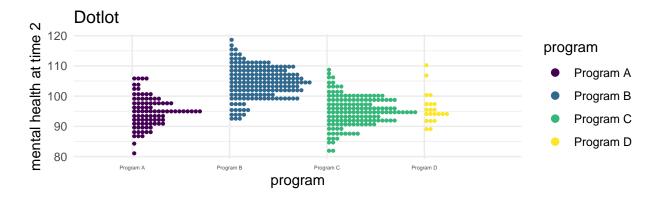

Figure 11: Dotplot

7 Second Approach (x is mental health; facet wrap on program)

Again, there is a *lot of code* below. This is where we are setting up the *grammatical logic* of the graphing approach.

8 Add Geometries

However, now that we have devoted *a lot of code* to setting up the *grammar* of the graph, it is again a relatively simple matter to try out different geometries.

8.1 Histogram

```
myplot2 +
  geom_histogram() + # histogram geometry
  labs(title = "Histogram")
```

Histogram

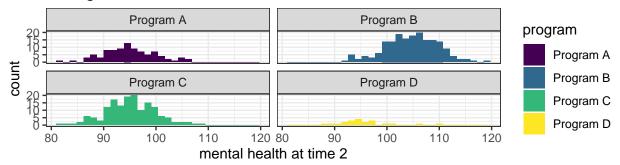

Figure 12: Histogram

8.2 Density

```
myplot2 +
  geom_density() + # density geometry
  labs(title = "Density")
```

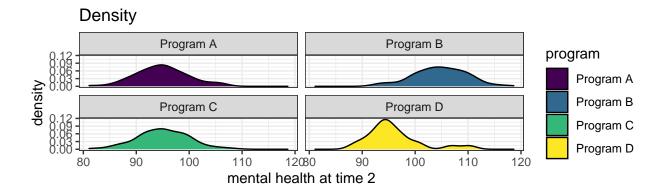

Figure 13: Density

9 Third Approach (x is mental health; transparent geometries)

One last time, there is a *lot of code* below. This is where we are setting up the *grammatical logic* of the graphing approach.

10 Add Geometries

And again, now that we have devoted a lot of code to setting up the *grammar* of the graph, it is again a relatively simple matter to try out different geometries.¹

10.1 Histogram

```
myplot3 +
  geom_histogram(alpha = .5) + # histogram geometry (transparent)
  labs(title="Histogram")
```

10.2 Density

```
myplot3 +
  geom_density(alpha = .5) + # density geometry (transparent)
  labs(title = "Density")
```

¹It is important to use (alpha = ...) to create transparency with these geoms.
